Model Properties

SACS_Option_1	VVRSM
SACS_Option_2	M = 4x round exit
SACS_Option_3	O = no heater
Controller type (0-3)	0
SACS_Option_4	S = compact MP (standard)
Operating side (0-1)	0
SACS_Option_5	R = right
Pre-pressure	100.000000 Pa

Basic version.
Connection type OUT.
Equipped with post-heater or not.
Selection field control equipment.
Selected control equipment.
Selection field equipment side.
Selected equipment side.
Setting inlet pressure controller*.

Notes

*It is recommended to apply an inlet pressure of at least 100 Pa to ensure proper operation of the control equipment. This value is the standard setting in the Revit model, so this value is used for calculating the transmission in the duct system to determine (critical path) the required pressure of the fan/AHU.

The actual inlet pressure may of course be higher when this unit is not in the critical path, but closer to the AHU or the fan. When you determine the inlet pressure, remember the pressure loss after the unit!

Please contact our advisers for your final selection.

Values for “Controller type (0-3)”			
0: Compact MP (standard)	1: Compact MOD	2: Compact KNX	3: Universal VRU (quick-running)

Values for “Operating side (0-1)”	
0: Equipment right (standard)	1: Equipment left

Revit does not provide for switching connectors on or off. Therefore we offer you six different families: with a post-heater (equipped with the water-side connectors, see the manual for the VVRSM_B), and without a post-heater, where there are three different versions for the outgoing connections on the air side.

VVRSM E	VVRSM M	VVRSM N
 NLRS_M_c02	 NLRS_M_c02 NLRS_M_c03 NLRS_M_c04 NLRS_M_c05	 NLRS_M_c02

The total of the outgoing air-side flows is passed on as air-side incoming flow (NLRS_M_c01_debiet).
